Citric Acid is used widely in agriculture and food production. It can be used to neutralize or acidify water, lower the pH in soil-less media and help increase efficiency of insecticides and herbicides. This food grade citric acid can also be used as a preservative and acidifier in food processing.

Suggested Use: To reduce soil pH in greenhouse and farm growing, 16 lbs. of citric acid dissolved in 4 gallons of water will make enough 50% solution to treat approximately 500 sq. ft. and will lower the pH by approximately 1 point. This solution is best applied through drip irrigation systems.

Store in a dry, sealed container. Keep dry until ready to use.
